

GENERATE BLACK MENU

FOCUSED • POWERFUL • EASY-TO-USE

Generate Black

This is a Spot Process engine (side) Menu ONLY.

As part of the Spot Process color separation algorithm you can create three levels of special Black channels to fit your needs. Black channels are important to the success of printing in all color garments/substrates except black. Preset options make it easy to succeed.

You will create a Black Separation from a saved file. Select the style that is best for the need of the particular job, locate your duplicate file (the one with a white or transparent background). The Black Separation is created and placed in the proper print order. Yes, printing halftone black early is proper to achieve great color balance and control. Separation data is better balanced with all Separations created from the same starting point.

Skeletal Black is used for a Black Separation that is strong in the shadow areas. Great for dark garments that just need a little black assistance.

Detailed Black is used for medium color garments that require better mid range control.

Sharper Black is used for medium to light garments and images that require the highest level of detail throughout the entire image.

Usually Black generated Separations do NOT require adjustments. The need to adjust is directly related to the quality of the original, but with most files they will be proper "as is."
